FORMER WACOM CUSTOMERS:

Telewave can support Wacom commercial and amateur products. Many Telewave products share a common design heritage with Wacom, and most of our cavity and isolator products are drop-in replacements for Wacom. We can repair, rebuild, and expand most existing Wacom items or systems without a complete change-out.

Telewave, Inc. delivers high performance ... everywhere, everytime.

We bring 30 years of product engineering and system design expertise to the table for every customer, large or small.

With a full line of standard products, and the ability to quickly create custom designs for special projects, Telewave provides unmatched support for Public Safety, Government, and Business radio systems.

Call us today at 1-800-331-3396, and discuss your requirements with our expert sales engineers, or visit us at www.telewave.com

Scanner users vs. scramblers

What's more important: the safety of police officers, firefighters and emergency medical service crew members or the ability for people to listen to their radio communications?

Put it that way, and the answer seems simple. But listening to radio communications may involve important rights, such as free exchange of public information on the Internet and the use of radio receivers.

We've heard from a few readers who like to exchange frequency lists and monitor public safety communications. Some have interpreted the advertising of information security devices (scramblers) as tossing listeners into a category with criminals and terrorists.

They were reacting to an advertisement in last month's issue that pictured a young man viewing a computer display of radio frequencies and that showed a firefighter with a two-way radio. The ad copy suggested that the use of scramblers might improve homeland security.

The advertisement alarmed some scanner hobbyists.

'In the clear'

Let's make our position plain:

The use of receivers to listen to any radio signal that contains information transmitted "in the clear" (not scrambled or encrypted) should be unrestricted. That was our position before the passage of the 1986 Electronic Privacy Act, and that's our position now. The Act placed more restrictions on receiver use in the United States than a free society should have. It's wrong, but it's the law.

The Communications Act's restriction on the use of information heard by unintended listeners (such as those who monitor public safety communications and who, in an earlier age, could lawfully listen to common carrier transmissions) is sufficient.

Radio users who want to ensure the privacy of their communications should use scrambling or encryption to prevent it from being understood by unintended listeners. That notion not only flows from

our support of unrestricted receiver use, it recognizes that possible sanctions do little to deter someone using a receiver to further an unrelated criminal act.

For example, if a bank robber is undeterred by a possible prison sentence of 20 years to life, he won't worry about a possible fine for using a receiver to listen to the bank's security service frequencies.

Here's another thing: No reasonable person would begrudge a public safety agency's use of scrambling or encryption to protect their people during tactical operations.

For example, police officers, firefighters and emergency medical service crew members responding to emergencies involving hostages, snipers, armed assailants and a variety of other volatile circumstances can be well-served by scrambled or encrypted radio communications that cannot be understood by criminals, reporters and the public.

Meanwhile, the public can be well-served when public safety communications involving fires and vehicle collisions can be

monitored and reported for the benefit of commuters. Maybe you know of other examples when members of the public have rendered aid as a result of something heard on receivers.

Free speech; no censorship

Now, about advertising in general: Most advertising is protected free speech. We would no more censor an advertiser's message than we would censor a guest editorial or a letter to the editor that takes a position contrary to ours.

And about the particular advertisement in question: A frequency-searching computer user *can* compromise the security of public safety workers, including firefighters. Such a user might be a stringer for a newsgathering organization, might otherwise pass the information along in such way that it falls into mischievous hands, or might himself be someone with a harmful purpose. A firefighter responding to an emergency is entitled to as much protection as possible. Under some conditions, that protection should extend to communications.

Protecting public safety workers shouldn't involve restrictions on receiver or computer use, but it may well involve scrambling or encryption. The advertisement was placed to sell a product, but it also did a service in reminding public safety agencies that radio transmissions made "in the clear" may, at just the wrong time, be heard by a listener who might misuse what he hears in a way that—intentionally or not—places lives, health or property at risk.

VOICE **Plus** ENCRYPTION SCRAMBLER

MODEL NC804

\$129.95

(1-9 pcs.)

The Model NC804 is a micro-miniature voice-plus pseudo-random rolling code scrambler designed to provide high level security for two-way radio voice communication systems. It's unique digital encryption processing algorithm, plus it's many features makes the Model NC804 a perfect cost effective solution for high-end voice encryption scrambling for commercial users, police departments, public safety organizations and other systems as a defense against unauthorized interception of private and sensitive voice transmissions by casual or even the most determined listeners. The Model NC804 features 8 user code keys with over 20 trillion codes to choose from. Kill disable for stolen or lost radios, over the air programming for changing of units operating parameters without removal from radio. Measuring .90" W x 1.30"L x .22"H, the Model NC804 supports limited space applications and is plug compatible with our popular Model NC802 voice inversion scrambler making it ideal for system upgrades.

Our state of the art built in diagnostics not only spots trouble, it recommends immediate corrective action. This could mean up to a 50% savings in support costs.

down to the component level. It's always running in the background to maximize uptime and minimize costs.

You can easily customize any screen. Buttons can be easily changed.

The Radio Dispatch component of the new Moducom UltraCom™ E911/Radio Dispatch Console System is the most flexible system available. Our 100% user programmable touch screens can easily tailor screens for each dispatcher's specific situation. As circumstances change, system wide changes can be made by your technicians instead of costly factory programmers with our built-in tools.

The UltraCom is an all digital 32-bit Windows system, built by us from the ground up - not an assembly of older multiple systems. We build in dual instant recall recorders at no extra cost - saving \$5000 per workstation. Our built-in automatic & manual diagnostics can save up to 50% on support costs. And our software upgrades are always free.

Every UltraCom 2000 radio Dispatch console system contains all the software and most of the hardware necessary for a state of the art E911 system. Radio Dispatch and E911 in one single software application means lower costs, greater reliability and more flexibility.

For totally cost effective, totally programmable, totally flexible radio dispatch contact Moducom today.

by the customer instead of expensive factory programmers. Levels on audio channels can be easily adjusted.

E911 is part of the UltraCom system software. This means you only need to add minimal hardware to obtain a single application radio dispatch and E911 console system.

CIRCLE (8) ON FAST FACT CARD

Interoperability: It's about saving lives

When a hijacked plane hit the Pentagon on Sept. 11, interoperability helped public safety agencies respond quickly. This incident is just one example of how successful radio communications can save costs, resources and lives.

By James Careless

Interoperability saves lives and speeds response.

At no time was this proven more clearly than on Sept. 11, after the attack on the Pentagon. In contrast to the attack on New York, where a lack of network interoperability hampered rescue efforts, most police, fire and EMS crews responding in the District were able to talk to one another easily. The results—as we shall see—speak for themselves.

The Sept. 11 Pentagon response isn't the only instance in which interoperability has made a difference. Moreover, quick response isn't the only advantage offered by interoperable public radio systems, although it is the most dramatic.

Interoperability also helps to reduce per-agency costs while boosting network performance and coverage. It's a smart way to overcome budget constraints and environmental concerns, and it fosters cooperation among police, fire and EMS agencies.

Increased cooperation cannot come too soon; in the wake of Sept. 11, there's no room for turf fights among public safety services. With the ominous, continuing threat of similar horrific attacks, creating interoperable networks is a good way to foster cooperation on a larger scale and a relatively unthreatening way to begin.

Interoperability can mean putting everyone on a common

frequency with common modulation, but it doesn't have to. Sharing portable radios among departments, so that messages can be exchanged during emergencies, is another form of interoperability.

So, too, is the ACU-1000 Modular Interconnect System. As described in the February 2002 issue of *Mobile Radio Technology* ("Chicago Blazes a Trail to Interoperability"), the ACU-1000 lets you plug in as many as 10 radios, whatever their frequencies, and connect them as if you were using a telephone switch.

Careless is a freelance telecommunications writer based in Ottawa, ON, Canada. His email address is james@tjtdesign.com.

CIRCLE 115 ON FAST FACT CARD

But interoperability isn't just about hardware; it's about cooperation and shared planning—which leads us to Washington.

Interop lifeline

Jan. 13, 1982: Air Florida Flight 90 crashed into the 14th St. bridge during a snowstorm. More than 70 people lost their lives when the wreckage sank into the river.

Police, fire and EMS crews quickly responded to the scene, only to discover that they couldn't coordinate their efforts because they couldn't talk to each other by radio.

Almost 21 years later, the hijacked American Airlines Flight 77 crashed into the Pentagon. Again, lives were lost. But this time, radio communications were different. Local public safety agencies—and the governments that fund them—had learned from the Air Florida tragedy. This time,

they *could* talk to each other.

In fact, 900 users were able to communicate on an 800MHz digital system, everyone from Washington Police to Arlington County, VA, rescue, plus 48 other agencies. Thanks to mutual aid plans already signed and coordinated by the region's Metropolitan Council of Governments and a history of joint mass-emergency drills by the area's public safety agencies, everyone knew how to work together on Sept. 11.

Best yet, Washington-area agencies had instituted a formal Incident Command System for large emergencies before the attack, so the chain of command was clear.

The bottom line: On Sept. 11, 2001, "the public safety networks

in Washington worked well," said Deputy Chief John Clayton of Washington's Fire and Emergency Medical Services. "The only real challenge, as far as radio communications was concerned, was that some out-of-town companies didn't have 800MHz radios, so we had to set up relays."

This one gap in interoperability was cited in a report, "Answering the Call: Communications Lessons Learned from the Pentagon Attack." Issued by the Public Safety Wireless Network Program, a joint effort sponsored by the U.S. Departments of Justice and the Treasury, the report noted that "during the initial response, the majority of local public safety responders experienced no difficulty in establishing interoperable communications on the scene. This was because of the high-level of regional coordination and agreements previously established. However, as the number of state and federal agencies (secondary responders) increased at the site, interoperability presented new challenges. No means of direct interoperability was immediately available to these secondary response agencies."

Nevertheless, the overall response to the Sept. 11 Pentagon attack was a ringing endorsement for interoperability. "It made the difference," said PWSN program man-

ager Rick Murphy. "The Pentagon incident demonstrated in a very public way how critically important communications capabilities are for public safety agencies."

Florida defense

As monstrous as they are, terrorist attacks aren't the only problems public safety networks face.

In South Florida, various levels of government face radio-related problems. For the U.S. Immigration and Naturalization Service and the U.S.

Border Patrol, one challenge involves illegal immigrants from Cuba. For the Florida Highway Patrol, it's watching the region's freeways. And the Miami-Dade Police Department polices one of the nation's busiest areas.

With financial help from PSWN, all three levels of government increased their cooperation. Rather than continuing to operate apart, "we set up three hubs," said the MDPD's Capt. Jesse Varnell. "One handles local government; the second handles state agencies, and the third supports federal users like the INS, the U.S. Customs service, the U.S. Coast Guard and the Border Patrol."

Through these hubs, everyone can talk to one another. "We can go car-to-car with state, federal, and local agencies," said Varnell. "We can also patch an FBI officer through the Border Patrol's hub directly to a MDPD tactical unit, and back again with no problems."

Still, not all of these agencies operate radios on the same wavelength. For instance, the MDPD is on 800MHz, and the state police is on 155MHz.

No problem: PSWN has supplied Dade, Broward and Monroe Counties with a TRP-1000, the transportable version of JPS Communications' ACU-1000 radio switch. "If we're faced with a mass immigration

CIRCLE (10) ON FAST FACT CARD

Today, this interoperable facility is saving money and hassles, while helping its state and federal users save lives.

coming in from the sea, we can drive the TRP-1000 to the scene and plug in our various radios," said Varnell. "This way, we can all communicate with each other."

So, even though they haven't

Montana's new tower and transmitter site, a result of PSWN's funding, is in Red Lodge.

migrated to the same bandwidth, agencies in South Florida can talk to one another as needed.

Montana improvement

In Montana, the federal Bureau of Land Management had a radio problem. Its transmitter building at Red Lodge was run down and in need of repair.

The bureau wasn't alone; two other public safety sites in the area were in similar dire straits, said Douglas King, the BLM's telecommunications manager in Montana. "All of the buildings were several decades old and poorly constructed," he said. "We were all ready to tear them down and start again."

Enter PSWN with funding and coordination help. The result: Six agencies—the BLM, the FBI, the U.S. Forest Service, Carbon County, the Montana Department of Transportation and Montana's Highway Patrol—pooled their operations into a single location. Known as the Palisades Project, the new tower and transmitter site is in Red Lodge.

"I think it was the right way to go," said King. "No one single agency could have afforded to build such a facility. In the long run, we'll all save a huge amount of money, while providing solid, coordinated coverage for the public."

The Palisades site construction began in 2000 and soon shut down for much of a long, dry summer because of the fire risk. Then, when winter arrived, the site was buried by snow and the road was taken out by a landslide.

Still, the Palisades site was officially opened in September 2001. Today, this interoperable facility is saving money and hassles, while helping its state and federal users save lives.

Lessons learned

Put plainly, interoperability makes sense. It's a cost-saver, a resource saver and a life-saver.

Moreover, interoperability encourages inter-agency cooperation. This, in turn, improves overall emergency response for police, fire and EMS.

It's as simple as that.

Need Remotes? Call Us

TR810

TTP216

Multi-Channel

CPI manufactures a complete line of DC, Tone, Local Extension, Multi-Channel, and Multi-line remotes and termination panels for most radio systems.

The CPI line of Multi-Channel remotes includes systems for the Kenwood -80 and -90 series as well as Motorola's CDM1550(LS) and M1225 Series. CPI's new TTP216 tone termination panel is now available and the TR810 console and TR Multi-freq remotes will be available in the next several months.

Same products. Same people. Same reliability.

New name.

The R2600 family of Communication System Analyzers is now part of General Dynamics. They're the same fine products. Built by the same people. With the same durability and reliability you've learned to trust over the years. The only thing that *has* changed...is our name.

So whether your test requirements include iDEN®, ASTRO™, SMARTNET™/SMARTZONE™, SECURENET™ or APCO Project 25, call us.

Be sure to ask about the new features we've introduced this year:

- An available Full-Band Duplex Offset Generator
- RF Frequency resolution down to 50Hz
- Linear Simulcast Modulation (LSM) support for APCO Project 25

And for high-range capabilities at a low-range price, take a look at the R2590, our newest addition to the family—at a price you won't believe.

Call your General Dynamics sales rep today. The name on our products may have changed, but our commitment to quality hasn't changed a bit! Contact us toll free at 1-877-449-0600; in Arizona at 1-480-726-1048; or on the Web at <http://www.gd-decisionsystems.com/cte>

Demystifying software radio

Looking for a “magic bullet” two-way radio that covers all frequency bands, all channel bandwidths, all modulation techniques and all control and signaling protocols? Look no more—it’s *software-defined radio*.

By Stephen Bartlett

Taken to its logical extreme, a software-defined radio loaded with every imaginable software—plus frequency coverage and a tiny power pack worthy of a science fiction novel—could be used in any mode, on any frequency, anywhere in the world.

In a software-defined radio, transmitter modulation is generated or defined by a computer, and the receiver uses a computer to recover signal intelligence. Need interoperability among public safety agencies regardless of frequency band and standard or pro-

sponse. Also, it offers first responders the potential to save money on mobile and portable equipment replacement through its compatibility with legacy and future systems.

Commercial mobile radio service providers, as well as business and industrial end-users, can benefit from reduced network management costs, more competitive features and the ability to form wide-area coverage alliances.

If you’ve recently signed up for the latest cellular or PCS mobile wireless phone services, you’ve probably had services with choices from: coverage area, free minutes, email service, Web surfing, shoe shining, you name it. Whether you chose all of these, or only a few, you most likely opted for the best coverage you could get for the best price. If so, the phone you now own is one example of a software-defined radio—a programmable, dual-mode (analog/digital), multiband (cellular/PCS) wireless device.

interface standards. These terminals support wider roaming areas and provide mobile users with backward- and forward-compatibility as wireless technology evolves.

Reconfigurable radio — Wireless devices with software and firmware that can be reconfigured through programming hardware, including modern dual-mode, tri-band phones and many modern digital two-way radios, fit this category.

Flexible architecture radio — All characteristics of this radio are programmable. An ideal FAR would be able to configure the number of up and down conversion stages, intermediate frequencies, filter bandwidths, modulation and waveforms, and RF bands. This is essentially the Holy Grail—the “one radio fits all”—of software radio. We’re definitely not there yet.

The SDR technology vision is to make common hardware to perform many functions and operate with numerous protocols defined by resident software that can be changed when different functions, features or protocols are required. This can reduce costs with less maintenance and easier upgrading.

Fixed terminals, or base stations, normally are restricted to assigned frequencies and protocols for specific coverage areas. Mobile terminals and handsets require more flexibility to roam between coverage areas, with different frequencies and protocols.

Software-defined radio covers several types of technology and can mean different things. To simplify, three categories can be used to classify SDR technology: multistandard terminals, reconfigurable radios and the flexible architecture radio.

Multistandard terminal — Although not a pure software radio, the MST is a programmable radio (generally a base station terminal) capable of operating on many air

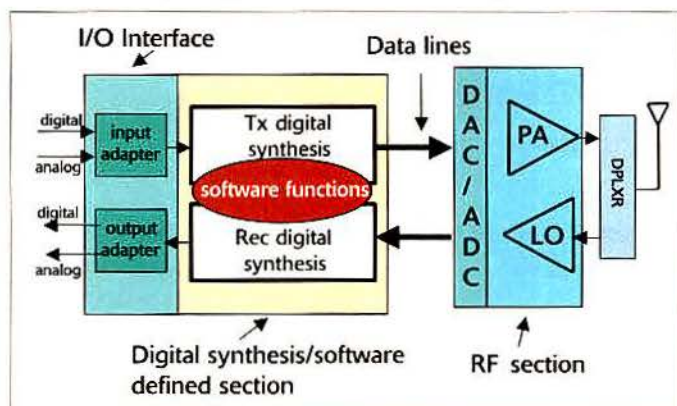

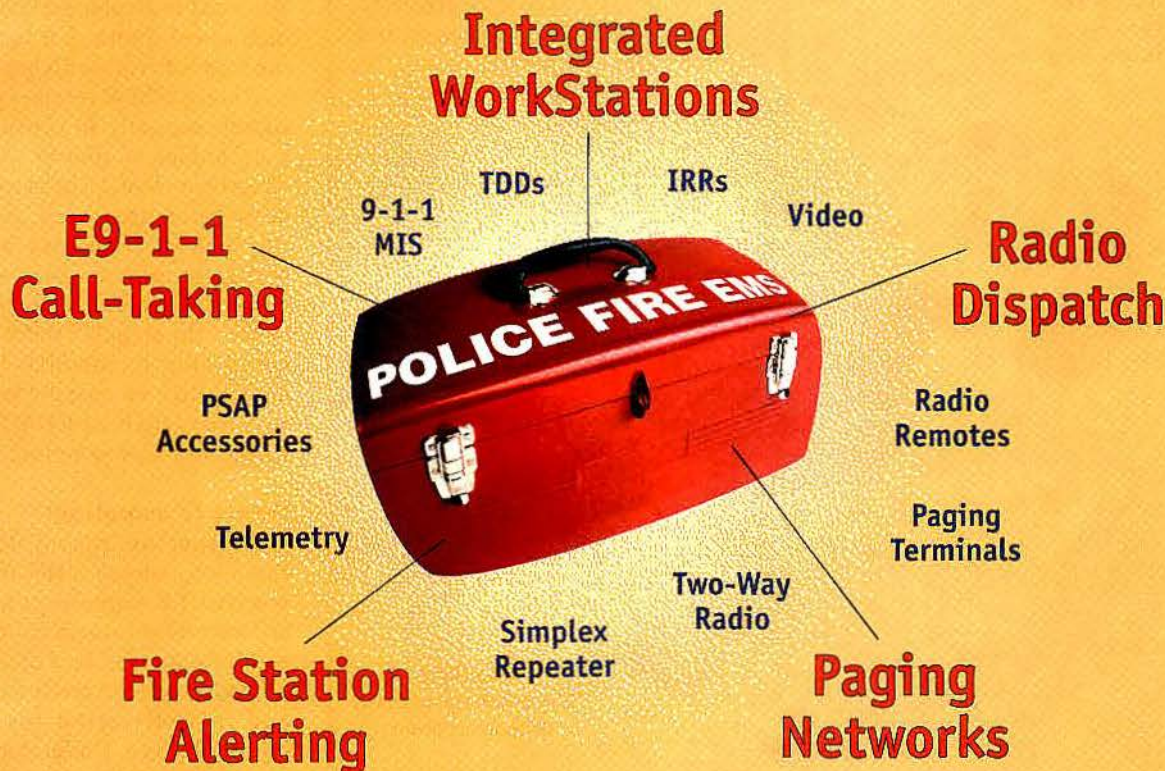

Figure 1. Software-defined radio concept.

prietary protocol? Need compatibility, wide-area coverage and data features for business users? That’s some of the promise—taken to the extreme, mind you—of software-defined radio.

Public safety agencies should watch software-defined radio development for its potential to replace expensive network-based interoperability often required for multiple-agency emergency re-

We Have All Your **Tools**

Mission-Critical Communication Systems

Whether you are building a new Communication Control System from scratch or remodeling an existing system, you need the right tools to ensure that you have an absolutely reliable and totally integrated system. Zetron offers a suite of tools designed to consolidate and simplify the task of handling emergency calls and dispatching response teams. From a single telecommunicator position up to 130 integrated workstations, Zetron can configure the perfect Public Safety Communication Control System for your operations. CIRCLE (13) ON FAST FACT CARD

Software-Defined Radio

The software radio can be divided into three sections (see Figure 1): input and output interface, digital synthesis and software-defined section, and RF section. Designers want to keep the information signal digital until it is absolutely necessary to convert to analog. Ideally, the signal stays digital right up to the antenna, where

transmit and receive RF stages perform signal conversions associated with RF amplification.

One way to do this in base stations is to string fiber optic transmission line up the tower into the RF "black box" attached to the antenna array. This method would promote the use of more efficient, lower-power, lower-temperature RF

circuitry. Without coaxial cable signal losses, less RF power would be necessary for transmission and low-gain, low-noise amplifiers would give satisfactory reception. System downtime and repair or replacement costs caused by moisture that penetrates coax would also be eliminated.

Digital hardware limits — Several technologies must mature before the ideal FAR can be made. The most critical need is for ultra-high-speed digital hardware that can host software with low latency.

When the SDR receiver samples signals digitally to convert them from analog to digital (ADC), or vice-versa (DAC), the sample rate must be at least *twice* as fast as the highest frequency or bandwidth sampled—so says the Nyquist Theorem. The capability to filter the signal in the minimum acceptable bandwidth and the availability of speed-compatible converters (ADC and DAC) dictate where and how sampling is done.

Direct IF sampling

Another approach, direct IF sampling, samples the incoming received RF signal at a rate that is twice the information bandwidth frequency. This approach is also referred to as *undersampling*, and is well-suited for speed-limited devices. Undersampling is an especially clever approach for detecting broad-bandwidth signals (high-speed data and video), but it has limited use in typical, very narrow bandwidth applications (low-speed data and voice). Direct IF sampling can eliminate much of the costly analog hardware needed for demodulation followed by lowpass filters to feed the baseband sampling circuit.

Most common ADC technology limits the rate of passband and direct receiver sampling to an upper bound of 30MHz—about 60 million-samples per second (MSPS). Manufacturers of newer high-speed ADCs are quoting sampling rates up to 300MSPS or greater, which could sample up to the middle of the VHF band, about

CIRCLE (9) ON FAST FACT CARD

150MHz. For higher frequencies, the RF signal must be down-converted to a lower frequency.

For now, software-based radios need special hardware for up and down IF conversion, filters and IF amplifiers because of the limitations of high-speed digital electronics. With densely packed integrated cir-

cuits, placing enough gates requires unrealistic power and size growth to accommodate the ideal FAR. Most SDRs include high-density application-specific integrated circuits (ASICs) and field-programmable gate arrays (FPGAs). But even these devices are being stressed by the 3G cellular technologies pushing for re-

lease. Although these new 3G technologies have been delayed for several reasons, foremost is a lack of practical hardware.

New hybrid digital signal processors, *associative string processors*, incorporate large numbers of specialized processors. Several manufacturers claim to have such devices ready for 3G systems elsewhere in the world.

Software latency — Software will provide ultimate SDR flexibility. The more processors in the hardware, the more software can be a part of the radio—for a price.

Processors generally call for service requests from specific software objects. Making these calls internal to a processor, or externally from another processor in the radio, takes valuable run time. Although internal processor calls have delays in tens of microseconds, external calls may have throughput delays on the order of milliseconds.

Millisecond delays are not usually an issue for typical data traffic, but such delays can be a serious problem for real-time communications such as emergency voice calls. As more features are programmed into the FAR—features are always added—these delays will grow. Delays are not usually an issue for typical data traffic, but can be a serious problem for real-time communications.

One solution is to move as many of the unchanging FAR functions as possible into hardware and firmware. Then, fewer software functions requiring service requests will need to be accommodated. Even so, as the newer, high-speed, processor-dense hardware becomes available, these systems will become feature-rich, requiring software latency to be closely managed during development to prevent uncontrolled latency growth—a computer evolution lesson learned.

Software radio has passed its newborn stage of development, but it still has a long journey ahead. We will watch it grow up as new commercial wireless systems are deployed. Maybe it's time to take some refresher software courses? ■

Crescend offers the most reliable amplifier available for the Land Mobile market. Our new series of amplifier's are built with LDMOS transistors. Our LDMOS amplifiers are more rugged because:

- LDMOS transistors have higher VSWR rating than bi-polar transistors,
- Amplifiers operating voltage of 28 volts DC lowers means lower current through devices.
- Better Thermal Properties- the LDMOS transistors are resistant to thermal runaway.
- Microstrip Design- We utilize microstrip matching techniques to reduce tuning capacitors.

Lattice Communications: EYE ON THE SKY

It's all about vertical real estate, location and customer relationships.

More than 350 towers are located in Alabama, Arizona, California, Colorado, Illinois, Indiana, Kansas, Kentucky, Nebraska, New Jersey, New Mexico, Ohio, Oklahoma, Michigan, Missouri, Pennsylvania and Texas. Lattice Communications is not stopping there. This privately held company not only leases and maintains tower space, but also looks at market portfolios to merge with and/or acquire towers that are in line with its business growth strategy to enhance its national coverage.

With CEO Dean Meiszer's focused leadership, and the 25 employees working with him, Lattice has built its success upon unprecedented responsiveness to their clients and the ability to provide multiple services for multiple sites through a single source. This single point of contact allows their clients to focus on their own core business and leverage Lattice Communications' experience to compliment and expedite the site development process.

The Lattice team, consisting of sales, engineering, business development, merger and acquisition and senior management, thoroughly understands its tower portfolio. They know firsthand what each structure looks like, its location and each specific competitive environment. The company maintains detailed documentation of their sites, reflecting all changes and/or additions in the market.

Lattice has implemented well-defined, fluid processes, which has earned the company the reputation of being efficient, thorough and expeditious. Often customers refer to Lattice Communications as "a breath of fresh air." These processes include:

- **Leasing process, including collocation application; site analysis; master lease agreement (MLA) and site lease agreement (SLA)**
- **Engineering/analysis process**
- **Merger/Acquisition process**
- **Build-to-suit process**

Lattice leverages its depth of experience to provide customers with creative solutions and exceptional service, as well as a sense of partnership. Lattice serves a variety of customers, including PCS, cellular, paging and broadcast providers, and wireless Internet and wireless data providers.

As a full-service tower ownership and site leasing company, Site Leasing Services include:

- Immediate response to engineering needs for siting decisions
- Expedited master lease process
- 24-hour site emergency response
- Site-ready for collocation
- Prime locations

As a full service build-to-suit and build-to-fill site provider to customers, Site Development Services include:

- Site acquisition and zoning
- Construction management
- Problem site solutions
- Project tracking reports

Founded/Ownership:

Founded in March 1999. A privately held company formed by a group of investors led by Lattice Investors, Ltd. (a Robert Bass affiliated organization), Cinergy Communications, Inc. (a subsidiary of Cinergy Corp. A gas and electric utility), and Lattice Partners, Ltd.

Nextel's international unit files for bankruptcy protection

A unit of Nextel Communications, Reston, VA, has filed for protection from creditors under Chapter 11 of the U.S. Bankruptcy code.

NII Holdings (formerly named Nextel International Inc.), announced on May 24 that it would restructure its debt, reducing the amount it owes creditors from \$2.7 billion to less than \$500 million. In reaching an agreement with creditors, the company made a commitment to obtain \$190 million in new capital, including \$140 million from bondholders. Nextel Communications would provide the remaining \$50 million in return for a cross-border, spectrum-sharing agreement.

Nextel Communications lost an estimated \$2 billion that it invested in NII, including about \$750 million in cash and stock poured into the company during 2001. At the end of last year, the parent company wrote off \$1.7 billion of the amount it had spent on NII.

After the restructuring, creditors will own 55% of NII, with Nextel Communications' stake reducing to 45%.

Motorola has agreed to defer principal payments on the secured vendor financing it provided for NII's purchase of its equipment.

Unsecured creditors also are to receive equity in the reorganized company. —DB

Feds give Johnson \$1.2 million P25 order

The E. F. Johnson company has received a \$1.2 million order for Project 25 digital radio products from an unspecified agency of the federal government.

The agency ordered 100W mobile radios with hand-held controllers from Johnson, a subsidiary of Lincoln, NE-based Transcript International. Transcript's chairman, Michael E. Jalbert, said that the company previously supplied such radios to the federal government and expects additional orders.

David L. Hattey, Johnson's president, said that the company's market share of federal government sales has increased thanks to the P25 product line.

—DB

Outdistance the competition...

Connect with a LTR® Networking system that will go the distance! **NET-LINK** is a software and hardware package that provides multi-user and multi-site linking between LTR® trunking systems.

With all the features your customers need and the return on investment your banker demands, **NET-LINK** eliminates the need for phone lines, microwave, or even other radio frequencies. No DTMF mics or other complicated signalling methods are needed—making **NET-LINK** nearly transparent to the end user.

20 years of consolidation: Bigger is not always better

As our magazine celebrates its 20th year, Pete Brake takes a look in the crystal ball:

Hindsight is 20/20. So instead, I'm going to go out on limb (not an unfamiliar perch for a small business person in the 21st century)

and discuss what I see happening in the wireless industry over the next 20 years.

The last couple of decades have seen consolidation, with bigger players acquiring many of the smaller ones. This has reduced the number of competitors, but it has not made the marketplace any less competitive. As a smaller player still hanging on to independence, I sometimes recall a concept a friend from the medical profession shared with me. He told me about the theory that "nature tends to the norm." In other words, even as we evolve, nature seeks a leveling point.

Nature senses when the relationship is unbalanced—as when two prize-winning horses have been bred to produce an individual that has received traits in part from one parent and in part from the other. But the two just don't fit to produce the same mechanics.

The same is true in business. Although merging two companies may make a more impressive entity, the combination may be less effective. Bigger is not always better.

First, we smaller companies have the ability to respond more quickly to emerging trends, and second, we have the capacity to provide stellar customer service. By consistently leveraging our flexibility and service capabilities, we will continue to find successful niches within the wireless communications field.

On the other hand, the FCC and other regulatory agencies tend to favor larger companies. Bigger organizations will continue to have the ear of decision-makers in a way that smaller entities seldom do.

So, as "nature tends to the norm," small companies have the opportunity to thrive through flexibility and responsiveness and larger organizations can flourish through volume and influence. Ultimately, there will be a place for all of us to prosper during the next 20 years.

Lightning protectors handle induced signals

Huber + Suhner's 3406 Slim Line lightning protectors provide surge protection for links between indoor and outdoor wireless communications equipment connected to coaxial lines to 5.8GHz, including base stations and subscriber units. The gas capsules' protection principle supports

simultaneous transmission of RF, data and dc. The gas capsules are fixed integrated. The protectors can handle any induced surge signals, including a one-time 10kA strike or multiple 5kA strikes. Slim Line is available with N, TNC and BNC connectorization and is bulkhead-mountable.

Monitor warns of ground degradation

Lyncole XIT Grounding's GRM 2000 RS monitors ground system performance and provides an early

warning of ground system degradation or loss of integrity. The system consists of a permanent wall-mounted meter and a sensing head (attached to the grounding system conductor). The meter features high- and low-level alarms for instantaneous notification when the pre-set resistance values are exceeded. It features continuous monitoring of ground system resistance and current and has an RS-232 output, with remote reading and control capability.

The New Field-Proven Site Master Performs Even In The Toughest Environments.

**Getting there and back
is up to you.**

The new C-Series Site Master features a handheld, battery-operated, field proven design so powerful, yet so small, that it fits in your backpack. Thousands of technicians just like you, have chosen Site Master because of its industry leading immunity to RF interference, ease of use, and its ability to pinpoint small, hard to find problems before major failures occur. New features such as on-screen test set-ups, multilingual user interface and InstaCal™ calibration further set the new Site Master apart from others.

Is it any wonder why Site Master is the world's best-selling cable and antenna analyzer? So, whether you're climbing a mountain or crossing a desert, your Site Master is built to perform under the harshest conditions. How well you'll hold up, we can't guarantee.

For more information call 1-800-ANRITSU or visit us at www.us.anritsu.com/SiteMasterC/. The Site Master from Anritsu. The preferred choice among leading network operators and service providers worldwide.

Product Encore

Antenna operates with integral ground plane

Telewave's ANT150F2 is a compact, omnidirectional col-linear antenna with an integral ground plane, which covers 148MHz-174MHz. The antenna is enclosed in a rugged structural composite radome, with a total height of only 60". The antenna's gain is 2.5dB minimum, with a nominal power rating of 500W. The vertical beamwidth is 38°, allowing RF coverage of low-lying areas such as valleys and canyons. This antenna is useful for replacement of old VHF ground-plane or "J-hook" type antennas. N female or optional 7/16 DIN female connectors are available. The ANT750F2 is a similar antenna that covers the 734MHz-806MHz range. Shadowing and

multipath common in the upper UHF bands can be greatly reduced with this antenna. The model ANT750Y5-WR is a heavy-duty directional yagi antenna that covers 734MHz to 806MHz. The gain is 5dBd minimum, with a nominal power rating of 500W. The antenna is coated with Txytan material to eliminate damage from corrosion. The active element connection and feedline are sealed inside the antenna boom.

Software manages SmartZone systems

GenSZAI (Genesis SmartZone Airtime Interface) from **The Genesis Group** captures all of the ATIA call packets and puts them into an SQL database. The database is used for all of the reports, graphs and queries that occur within the system. The information is accumulated and available for reporting on a near real-time basis. GenSZAI and NetVista work together with Microsoft Excel for reporting capability. Each report and graph is selectable and available on demand. The software is shipped with dozens of "canned" and custom reports. Clients can create their own ad hoc reports. Some of the canned reports include all airtime, PTTs & total airtime, busy seconds, top 40 talkgroup buses and PTT quantity & length.

WWW.GENESISWORLD.COM

Anritsu's five new Site Master analyzers offer enhanced menu-driven interface

Anritsu's five new Site Master analyzers are designed with a configuration that detects cable feedline and antenna system problems. The menu-driven interface has been enhanced to include cable-specific folders of popular cables. The characteristics of the cables and all appropriate testing parameters are programmed in the folders, which eliminates setup

error and ensures sweep accuracy. The feature complements the existing menu operations. The menu-driven interface has the ability to store as many as 10 test setups for repeatable testing, and it can store as many as 200 measurement traces in nonvolatile memory.

High-speed paging system uses GPS

Zetron's high-speed simulcast paging system uses GPS information to synchronize the transmission of paging signals to tight tolerances. This provides timing accuracy to within a few microseconds, which is necessary for many paging formats such as the Flex protocol. The system is intended for pub-

lic or private paging system operators that use multiple transmitters and wish to create new paging systems or to build out existing systems into new regions. Each system consists of a model 600 Wireless Data Manager and one or more model 620 wireless data encoders.

Employment

WIRELESS TECHNICIAN Torrance, CA

The City of Torrance is seeking a self-motivated, detailed oriented professional to serve as Wireless Technician. Under general supervision, the Wireless Technician performs skilled work in the installation, maintenance and repair of mobile and stationary radios, public safety lights and sirens, voice intercoms and recording systems, and other electronic communications equipment. REQUIREMENTS: Four years of experience in installing, maintaining and repairing radio and electronic communications equipment; valid California driver's license; and a high school diploma. The monthly salary range is \$3673 - \$4460 plus a comprehensive benefits plan. Visit www.tornet.com for details. Submit your completed standard City application and supplemental questionnaire by Thursday, June 27, 2002 at 5:30 p.m. Call (310) 618-2969 or apply on line at www.tornet.com.

CONFIDENCE:

THE ASSURANCE THAT CRITICAL RESOURCES ARE AT HAND

Immediate response is critical. Outcomes are not predetermined, and you can't afford faulty mobile communications.

STI provides the system you need to automate radio signal measurements and analyze the results with contour plots and measurement summaries. You get concise reports identifying weak spots in signal coverage, so you can address problem areas before unreliability becomes a liability.

Confidence fuels success. Make sure your team has the critical communication coverage necessary to succeed.

Rolling Code Scramblers

- High security - 1 trillion possible codes
- Superior audio quality
- Fleet management w/ CAD or DDU-300: ANI, Selcall, OTAR, & Deadbeat Disable

1200 Baud Data Modem

- Designed specifically for radio use
- Transparent or addressable modes
- Features data buffering & flow control

Speech Inversion Scramblers

- VPU-11: Factory programmable to any inversion code between 2000-4096 Hz
- VPU-12: 16-code version: 2200-4096 Hz
- VPU-15: 4-codes, ANI & encode/decode

Repeater Maker

- Remote access/disconnect using DTMF
- Programmable hang time/time-out timer
- 2 selectable Morse IDs, CTCSS filter

CTCSS/DCS Encoders/Decoders

- 38 CTCSS codes plus splits
- 106 DCS codes
- 64 memories (6-line binary)
- Available with ANI, TOT, & Penalty

**We've
Got
It
All!**

OEM Plug-In Products

- For Motorola, Icom, Maxon, Tait & Vertex
- We offer: Rolling code & inversion voice scramblers, ANI, & decoders

Universal Encoders/Decoders

- 2-tone, 5-tone, DTMF, &/or Pulse tone
- Features include ANI, selective calling, transpond, Deadbeat Disable, and more
- Microphone/dashmount versions available

Computer-Aided Dispatch

- MDC-1200®, DTMF, 5-tone, & GE-Star®
- Most models offer: aliasing, logging, spy, radio check, & Deadbeat Disable

Automatic Number Identifiers

- Available in MDC-1200®, GE-Star®, DTMF, 5-tone, & 2-tone
- Features time-out timer, emergency ANI, & leading &/or trailing ANI

Desktop Display Unit

- DDU Series: ANI Display Decoder with aliasing & last 10 ANI recall
- MDC-1200®, DTMF, 5-tone & GE-Star®

**LEADING THE WORLD IN ADD-ON
TONE SIGNALING PRODUCTS
FOR OVER 30 YEARS**

- ▶ One Year Warranty on all products
- ▶ Order Factory Direct - No Minimums
- ▶ Same day shipping on most orders
- ▶ Toll free voice and fax for easy ordering
- ▶ 24 hour "InfoFax" and website application notes for around-the-clock tech support

DCS-23

Digital Coded Squelch Encoder-Decoder
Jumper Programmable to all 106 DCS codes.
1.36" x 1.18" x 0.25"
\$59.95

FILTERS

Call us for the lowest cost, 12.5kHz channel spacing,
exact replacement crystal and ceramic IF filters for
part 90 Refarming. Complete kits available for
most popular radios at \$15.00 to \$25.00/kit.

ID-8

Automatic Morse Station Identifier
Meets all FCC ID requirements.
Fully field programmable with included keypad.
1.85" x 1.12" x .35"
\$69.95

PE-1000

Desktop Paging Encoder
Two-Tone Sequential.
Other formats and custom tones available.
7.5" x 7.8" x 2.7"
\$224.95

SS-64

CTCSS Encoder
Microminiature, DIP switch programmable.
Includes 64 tones from 33.0 to 254.1 Hz.
0.66" x 1.08" x 0.21"
\$28.95

TE-32

Multi-tone CTCSS Encoder
Rotary dial switchable to any of the standard 32 EIA tones.
5.25" x 3.3" x 1.7"
\$49.94
TE-32D with LED display, \$99.95

TP-3200

Shared Repeater Tone Panel
Full featured and with all 157 CTCSS/DCS codes.
Desktop and rack mounted versions.
\$279.95

TS-64

CTCSS Encoder-Decoder
Microminiature Jumper programmable.
Includes 64 tones from 33.0 to 254.1 Hz.
0.78" x 1.70" x 0.25"
\$54.95 (model TS-64DS with DIP switch, \$57.95)

**NOW MORE THAN EVER, YOUR BEST SOURCE
FOR QUALITY TONE SIGNALING PRODUCTS!**

WE'RE PLEASED TO ANNOUNCE THE ACQUISITION OF THE

Selectone

LINE OF TONE SIGNALING AND ENCRYPTION PRODUCTS,
TO BETTER FULFILL YOUR TONE SIGNALING REQUIREMENTS.

ST-20, 25, 50

Voice Encryption Units
PRIVATE COLLECTION series provides low to high level
security for two-way radio voice applications.
PC programmable with optional kit.
0.9" x 1.5" x 0.25"
\$79.00 - \$299.00

ST-804A

Multi Format Encoder
Encodes Two-Tone Sequential, Burst Tone,
or DTMF ANI/ENI Formats.
PC programmable with optional kit,
or factory programmed for free.
1.15" x 0.84" x 0.15"
\$59.95

ST-809B

Multi Output DTMF Decoder
Decodes address codes of 1 to 7 digits from
all 16 DTMF characters.
Multiple outputs and remote reset capability.
PC programmable with optional kit, or factory
programmable for free.
1.34" x 0.85" x 0.21"
\$59.95

ST-888

Desktop ANI Decoder / Display Unit
Use with ST-804A or other DTMF ANI encoders for
monitoring of fleet radio users and control systems.
\$499.00
